Soviet spy rays

Eavesdropping is bad enough, but eavesdropping that may be physically injurious to its human targets is an outrage. Such an outrage is reportedly being perpetrated by the Soviet Union in using possibly hazardous radiation to monitor conversations at the U.S. Embassy in Moscow. U.S. officials are said to regard the possibility of danger to staff members' health as sufficient to offer them transfers to other posts. Even Soviet skulduggery must have some limits, and common humanity dictates that risking radiation damage should be far outside them.
